

NEW LABASA POWER STATION CRANE

Robt Stone tendered for and won this job through a competitive international tender process. The work involved the complete design, manufacture, factory testing, freight to Lautoka (Fiji) and the onsite supervision of the installation and testing. The project was completed on time by FEA's own installation crew under the supervision of Robt Stone Erection Engineer. This crane was then subsequently used without downtime for the erection of the diesel generating sets in the new power station.
